C&L Sweeper Service monitors and analyzes nightly sweeping performance with Global Positioning Satellite (GPS) systems mounted on-board most of its power sweepers, as well as on other selected rolling stock.

Both C&L Sweeper Service and its customers receive many benefits from our operation of GPS-equipped sweepers. Routine analysis and available information include:

1. Arrival and departure times for each property being swept.

- a. This feature allows us to be sure adequate time is allotted for thorough sweeping of your property. We also analyze this data on a routine basis to ensure your pricing is correct for your property. Over time, we have adjusted rates both up and down as a result of our GPS tracking.

2. Sweeper speeds while on the property.

- a. We are able to ensure proper speeds are followed for optimum pickup performance.
- b. Monitoring provides ongoing compliance with our company safety program.

3. Sweeper path over the property.

- a. To ensure front, sides and rear of property are adequately swept.
- b. An 'electronic bread crumb trail' details the sweeper's path across each property.

4. Sweeper stops/durations at all locations while sweeping for clients.

- a. This ensures work proceeds diligently and responsibly so that all scheduled areas are serviced.
- b. Provides oversight to ensure that special services are provided, e.g., all trash cans are relined.

C&L Sweeper Service consistently maintains dependable, exceptional service by combining our onboard sweeper GPS system with manager on-site inspections. Our professionally designed system allows us to meet — and exceed — the standards that are desired by our customers and required by our management team.

All types of power sweeping... And, we don't just sweep anymore!SM
